

You will be given a list of integers, *arr*, and a single integer *k*. You must create an array of length *k* from elements of *arr* such that its *unfairness* is minimized. Call that array *arr'*. Unfairness of an array is calculated as

$$\max(arr') - \min(arr')$$

Where:

- *max* denotes the largest integer in *arr'*.
- *min* denotes the smallest integer in *arr'*.

Example

arr = [1, 4, 7, 2]

k = 2

Pick any two elements, say *arr'* = [4, 7].

unfairness = *max*(4, 7) - *min*(4, 7) = 7 - 4 = 3

Testing for all pairs, the solution [1, 2] provides the minimum unfairness.

Note: Integers in *arr* may not be unique.

Function Description

Complete the *maxMin* function in the editor below.

maxMin has the following parameter(s):

- *int k*: the number of elements to select
- *int arr[n]*:: an array of integers

Returns

- *int*: the minimum possible *unfairness*

Input Format

The first line contains an integer *n*, the number of elements in array *arr*.

The second line contains an integer *k*.

Each of the next *n* lines contains an integer *arr[i]* where $0 \leq i < n$.

Constraints

$$2 \leq n \leq 10^5$$

$$2 \leq k \leq n$$

$$0 \leq arr[i] \leq 10^9$$

Explanation

Explanation #01

Here $K = 4$; selecting the 4 integers **1,2,3,4**, unfairness equals

$$\max(1,2,3,4) - \min(1,2,3,4) = 4 - 1 = 3$$
